SwiftPOS Back Office Software Feature

Microsoft
Visual Studio .net
Professional
Microsoft
SQL Server

SwiftPOS Back Office POS Management Software is designed to manage a single venue or multiple venues running POS terminals linked to the back office. With the ease of installing Private Networks over broadband, it is now possible to centralise your data management systems with secure remote access to selected information.

SwiftPOS is a suite of Software Modules that manages the back office functions and links the Point of Sale Terminals together to create a total POS solution. The Software provides comprehensive management of inventory, membership, loyalty and financial control of the venue. With integration to security cameras, it can help detect problems such as theft and wastage before they get out of hand. You know exactly what your Inventory-on-hand is, up until the last sale, with the real time processing of sales transactions.

SwiftPOS has been written using the latest Microsoft .NET development environment for ease of deployment and uses the Microsoft SQL Server platform for maximum reliability and performance. There is no limit to the amount of data intelligence that can be stored in your SQL database for future analysis. Accessing your data over the Internet is just as fast as if you were in the same office as the main SQL Data Server.

Using the features available in the SwiftPOS Membership/Accounts & Loyalty software that are fully integrated with the POS Terminals, there is no double handling of transactions and it is done with a minimum amount of effort and can return excellent results.

While the POS Terminals will run standalone with no central point of failure, advanced features which draw information from the Host PC can be utilised with all the benefits of an on-line POS system. These include integration with SwiftPOS real-time Loyalty, Links to Poker Machine Loyalty Systems and Property Management systems are also provided by the SwiftPOS suite of products.
